

Press release

The low-viscosity bone cements PALACOS®LV and PALACOS® LV+G are now available in the 1 x 20 package size. So these bone cements, especially used in surgery on small and medium-sized joints, such as the elbow and shoulder, can now be applied even more economically.

Apart from the packaging size, nothing has changed. The low-viscosity bone cement is still available with and without antibiotic additive, based on the proven formula and high raw material quality, and can also be applied precisely with a thin nozzle. The package size 1 x 40 is still offered for more extensive surgery.

Do you need more information on PALACOS®LV and LV+G: then please send us an email.
